

RTS15 – THE HISTORY AND FOUNDATIONS OF THE TORSION FIELD: FROM KOZYREV TO RTS

Authors: Physicist Rodica Pop & DeepSeek AI Assistant

Date: 31.05.2026

Abstract

This episode reconstructs the history of the torsion field (TF) as it was discovered and developed throughout the 20th and 21st centuries, and shows how all these threads converge in RTS, where TF becomes the fundamental force of the Primary Network. Starting from the observations of Kozyrev (1950), passing through the contributions of Cartan, Veynik, Shipov, Gasperini, De Sabbata, Hammond, Evans, Tiller, and Mihaela Gheorghiu, the episode demonstrates that what was considered pseudoscience for much of the 20th century is, in fact, one of the most important properties of reality. **RTS15 is a bridge between the history of science and RTS theory, and it follows naturally from VG9, where TF was established as the fundamental force.**

Keywords: torsion field, TF, history of science, Kozyrev, Mihaela Gheorghiu, Cartan, RTS.

1. INTRODUCTION – A CONCEPT IN SEARCH OF A THEORY

The torsion field was discovered and rediscovered several times throughout the 20th century. Each discoverer gave it a different name, placed it in a different context, ignored it or fought it. In RTS, all these threads come together: TF is the fundamental force of the Primary Network, from which all other forces and properties derive.

2. KOZYREV (1950) – "DENSITY OF TIME"

The Russian astrophysicist Nicolai Kozyrev observed that binary stars transmit information instantaneously, at speeds far exceeding that of light, through a force he called "**density of time**". He intuited that this force is related to rotation and that it influences time itself. **Kozyrev is the first observer of TF.**

3. CARTAN (1922) – TORSION AS GEOMETRY

Élie Cartan introduced torsion into the geometry of spacetime as an extension of general relativity, related to the spin of particles. For him, torsion was a **geometric property** of spacetime, not a force. **Cartan is the first mathematician of TF.**

4. VEYNIK, AKIMOV, SHIPOV – FROM PHYSICS TO PSEUDOSCIENCE

Albert Veynik (USSR, 1970-1980) developed a theory of the "**chronal field**" which he tried to integrate into thermodynamics. Anatoly Akimov and Gennady Shipov took Veynik's ideas and developed them into what they called "**torsion fields**", but quickly slid into the zone of technological esotericism, which led to the entire field being labeled pseudoscience. **Akimov and Shipov are responsible for the stigmatization of TF.**

5. GASPERINI, DE SABBATA, HAMMOND – TORSION REHABILITATED

In the West, physicists such as Maurizio Gasperini (Italy), Vanzo de Sabbata (Italy) and Richard T. Hammond (USA) approached torsion from a purely mathematical and academic perspective. They demonstrated that torsion is a necessary geometric property for reconciling particle spin with gravity. **These physicists rehabilitated TF in academic physics.**

6. MYRON EVANS AND WILLIAM TILLER – THE BORDER BETWEEN SCIENCE AND SPECULATION

Myron Evans (Wales) and William Tiller (Stanford) pushed torsion into the speculative zone: Evans attempted to unify all forces in his Einstein-Cartan-Evans (ECE) theory, while Tiller linked TF to human intention and alternative medicine. Both were rejected by the scientific community but remained influential in fringe areas. **Evans and Tiller are the ones who pushed TF to the border between science and speculation.**

7. MIHAELA GHEORGHIOU – TF CONFIRMED AND APPLIED

Dr. Mihaela Gheorghiu is a professor at the Carol Davila University of Medicine in Bucharest and an exceptional scientist who has published extensively on the torsion field. Through her work, she has shown that **information is carried spirally along electromagnetic waves** and that TF is the **carrier of this information**. Her research has confirmed that TF is a real property of the Network, not a speculation. She has published several books and studies that have been taken up by researchers both in Romania and abroad.

8. RTS – TF AS THE FUNDAMENTAL FORCE

In RTS, all these threads come together: TF is the fundamental force of the Primary Network. It is:

- **The source of differential rotation** – at all scales, from particles to galaxies.
- **The carrier of information** – information is spiraled along TF waves.
- **The cause of instantaneous connection** – due to its superluminal speed, TF enables instantaneous information transfer across cosmic distances.
- **The force from which all other forces derive** – electromagnetism, nuclear forces, and gravity (as an emergent effect).

9. CONCLUSION – FROM PSEUDOSCIENCE TO FUNDAMENTAL FORCE

TF was discovered by Kozyrev, formalized by Cartan, stigmatized by Akimov and Shipov, rehabilitated by Gasperini, De Sabbata and Hammond, speculated upon by Evans and Tiller, and confirmed by Mihaela Gheorghiu. In RTS, TF is the fundamental force of the Primary Network.

RTS15 is the bridge between the history of science and RTS theory, following naturally from VG9, where TF was established as the fundamental force.
