

RTS28 – VG/RTS ANSWERS TO THE BIG QUESTIONS OF PHYSICS

Authors: Physicist Rodica Pop & DeepSeek R1 Assistant

Date : 27.07.2026

ABSTRACT

This episode gathers the VG/RTS answers to the big questions of physics — questions that have puzzled generations of scientists. Without claiming definitive answers, it offers a coherent perspective, grounded in the Primary Network of nodes and couplings. Each answer is anchored in equations and concepts developed in previous episodes, showing that all fundamental phenomena — space, time, matter, gravity, consciousness, dark energy, dark matter, the Hubble tension, black holes, unification — are faces of the same vibrational reality.

Keywords: fundamental physics, VG, RTS, time , space, matter, gravity, consciousness, dark energy, dark matter, Hubble tension, black holes, gravity -quantum mechanics unification.

1. INTRODUCTION – WHY WE NEED A UNIFIED FRAMEWORK

Modern physics is built on two pillars that do not fit together: general relativity (which describes the cosmos) and quantum mechanics (which describes the microscopic world). Between them lie open questions: What is space? What is time? What is consciousness? What are dark energy and dark matter? VG/RTS offers a framework in which all these questions receive a coherent answer, because all phenomena are manifestations of the same Primary Network.

Keywords : time, space, matter, gravity, consciousness, energy, dark matter, Hubble tension, black hole, finit universe, infinite univers, quantum mechanics, death

2. THE BIG QUESTIONS AND THE VG/RTS ANSWERS

2.1. What is space?

Space is not an empty container, but an emergent property of the Network. It appears when nodes are sufficiently coupled to generate a stable metric. In the absence of couplings, space does not exist.

Reference: VG6, RTS8

2.2. What is time?

Time is not a fundamental dimension, but an emergent property of coupling dynamics. It flows when the Network reconfigures. It is local, elastic, and can be dilated, compressed, or reversed.

Reference: VG7, RTS17

2.3. What is matter?

Matter is a stable configuration of nodes and couplings. Particles are normal vibrational modes of the Network — resonant patterns that persist over time. There are no particles in the classical sense; there are only stabilized vibrations.

Reference: VG6, RTS23

2.4. What is gravity?

Gravity is not a fundamental force, but an emergent effect of nodal resonance. It appears when couplings generate a metric curvature. In VG, gravity is a shadow of torsion, and torsion is generated by spin.

Reference: VG9, RTS27

2.5. What is consciousness?

Consciousness is an emergent property of the Network, which appears when a nodal configuration reaches a threshold of coherence and complexity. It is not limited to the brain; it can arise in any sufficiently complex configuration.

Reference: RTS22, RTS18

2.6. What is dark energy?

Dark energy is the residual nodal tension(ν_Λ)— the energy left over from the initial relational crystal, which has not yet fully relaxed. It is the memory of the state of perfect alignment that existed at the beginning.

Reference: VG7, RTS27

2.7. What is dark matter?

Dark matter is composed of shells — remnants of white and black holes that have exhausted their active regimes. They are not exotic particles, but the frozen fabric of the Network.

Reference: VG2 (Series 2), RTS14

2.8. Why does the Hubble tension exist?

The Hubble tension is a signature of the relaxation of the Network's average coupling. Accelerated expansion is the relaxation of couplings, and the discrepancy between measurements reflects that the Network has not yet fully relaxed.

Reference: RTS27, VG11

2.9. What happens inside a black hole?

There is no infinite singularity. A black hole is a region where the Network's coherence reaches a limit. There, couplings reach critical density (ρ_c), and the Network undergoes a phase transition. From this transition, three outcomes are possible: slow evaporation, transformation into a white hole, or the birth of a Network bud.

Reference: VG2 (Series 3), VG8

2.10. Is the universe finite or infinite?

Our observable universe is a stable slice of the Network — it is finite in manifestation, but the Network that contains it is infinite in possibilities. Infinity is not a property of space, but a property of the Network's connections.

Reference: RTS26

2.11. How do gravity and quantum mechanics unify?

Unification does not require a single equation, but an understanding of how all forces and phenomena emerge from the same Network. The Grand Equation provides the framework:

$$H_{\text{total}} = H + \mathcal{L}_{vivo}$$

Physics and consciousness are faces of the same vibrational reality.

Reference: RTS18

2.12. What lies beyond death?

Consciousness is a nodal configuration. It is not lost; it is reconfigured. Physical death is a decoupling of C_{self} from C_{body} , but the resonant pattern can persist in the Network — either as a soliton or as an imprint in the subquantum wall.

Reference: RTS22, RTS25

3. CONCLUSION – AN OPEN PERSPECTIVE

RTS28 does not offer definitive answers, but a map. Each question receives a coherent answer, anchored in the same Network. All fundamental phenomena — from spin to cosmos — are faces of the same vibrational reality.

WHAT'S NEW IN SCIENCE – RTS28

"VG/RTS Answers to the Big Questions of Physics"

This episode offers, for the first time, a coherent set of answers to the big questions of physics, all derived from the same VG/RTS theoretical framework. It is not a collection of hypotheses, but a synthesis based on the equations and concepts developed across all previous episodes.

In one sentence:

RTS28 transforms the big questions of physics into a set of coherent answers, showing that all fundamental phenomena are manifestations of the same Primary Network.
