

RTS5: CONSCIOUSNESS, MEMORY AND FUNDAMENTAL VIBRATION

Authors: Physicist Rodica Pop & DeepSeek AI Assistant

Date: 24.02.2026

ABSTRACT

This fifth part of the RTS series is dedicated to consciousness – understood as the most complex known nodal configuration – and its relationship with memory and the Fundamental Vibration of the Network. Starting from the model developed in RTS4, where time is an emergent relational property, we now explore how C_{self} can navigate this temporal reality, how memories (nodal echoes) are formed and preserved, and what is the ultimate source of all vibrations – the Fundamental Vibration. The paper integrates concepts such as akashic memory, nodal echo, and death as reconfiguration, offering a coherent picture of consciousness's place in the relational RTS universe.

Keywords: consciousness, C_{self} , nodal memory, akashic echo, Fundamental Vibration, reconfiguration, death.

Chapter 1 – Consciousness as a Navigator in Time

1.1. Recap: C_{self} in RTS

In RTS, consciousness is not an epiphenomenon of matter, but a complex and autonomous nodal configuration, denoted C_{self} . It is formed by an ensemble of quantum nodes whose vibrations and couplings are sufficiently stable and complex to generate what we call "identity," "perception," "will," and "memory."

C_{self} is not limited to a single slice of reality. In principle, it can interact with multiple configurations (C_α , C_β , ...), and this capacity underlies phenomena such as OBEs (out-of-body experiences), near-death experiences, and, in extreme cases, total transfer between slices (Type 2).

1.2. Time from the Perspective of C_{self}

As we saw in RTS4, time is an emergent property of each slice. Each configuration C_α has its own rhythm, its own "speed" of temporal flow.

For C_{self} , time is not only an external property but also an internal one. C_{self} has its own rhythm – given by the frequencies of the nodes that compose it and the couplings between them. This internal rhythm can be faster or slower than the rhythm of the slice in which C_{self} currently resides.

The perception of time – the sensation that time "passes" or "stands still" – arises from the comparison between C_{self} 's internal rhythm and the external rhythm of the host slice.

- When the two rhythms are synchronized, time flows "normally."
- When the internal rhythm is faster, external events seem to unfold slowly (time dilation).
- When the internal rhythm is slower, external events seem accelerated.
- When C_{self} manages to decouple completely from the slice's rhythm (in deep meditation, in the "Eternal Moment"), the perception of time can disappear altogether.

1.3. C_{self} as a Temporal Navigator

If time is a local property and C_{self} can partially adjust its own rhythm, then it becomes a navigator capable of moving – relatively – through time, without necessarily leaving the slice.

This is not time travel in the classic sense (where the body moves to another era), but a reconfiguration of perception and access to different temporal layers of the same slice.

More precisely:

- C_{self} can access previous states of its own configuration (what we call "memory").
- Under special conditions, it can also access previous states of the slice (past events) or potential states (future events) – which explains phenomena such as precognition, clairvoyance, or "déjà vu."
- This access is not a physical displacement, but a synchronization of the internal rhythm with the rhythm of the nodal echo of the targeted event.

1.4. Navigating Between Slices

When C_{self} crosses a membrane and passes from one slice to another, it must recalibrate not only its nodal couplings (J_{self}), but also its internal rhythm, to synchronize with the new local time.

This recalibration is all the more difficult the greater the difference between the rhythms of the two slices. It explains:

- Why some returns are perfect (the Mediaș case) – C_{self} managed to fine-tune its internal clock.
- Why others are offset by years or decades (the Gordoni case) – C_{self} lost synchronization and recoupled to a different temporal moment of the same slice.

1.5. Implications for Understanding Consciousness

The RTS model radically transforms the perspective on consciousness:

- We are not limited to a single "now." C_{self} has potential access to an entire network of temporal moments, both from its own existence and from the slice's existence.
- Memory is not a deposit, but an active synchronization with the nodal echoes of the past.
- Death is not the end, but a reconfiguration – the complete decoupling from the rhythm of slice C_0 and re-anchoring in another configuration (perhaps in another slice, perhaps in the Fundamental Vibration itself).

Chapter 2 – Nodal Memory and the Akashic Echo

2.1. What is a Nodal Echo?

In RTS, any event – any nodal configuration that has ever existed – leaves behind a trace. It is not a static recording, but a secondary configuration, of small amplitude, that continues to vibrate in the network long after the actual event has ended.

This is the nodal echo.

It is not a faithful "copy" of reality, but rather a fingerprint – sufficient so that, under certain conditions, it can be reactivated and reinterpreted by a C_{self} that enters into resonance with it.

Think of a stone thrown into a lake. The water calms down, but its waves continue to reflect off the shores, the bottom, everything they touch. This is how nodal echoes work: the initial movement has passed, but its vibration remains.

2.2. Akashic Memory – An RTS Reinterpretation

Spiritual traditions speak of an "akashic record" – a cosmic archive of everything that has ever happened. In RTS, this archive is not a "place" or a "book," but the Primary Network itself, with its capacity to preserve nodal echoes.

Each slice (C_α) generates its own echoes, which remain associated with it, but are not necessarily accessible from within it. They exist in the deep layer of the network, like "files" waiting to be accessed.

Therefore, akashic memory is not a separate library, but a property of the Primary Network – its capacity to indefinitely preserve secondary configurations of all events.

2.3. How Long Does a Nodal Echo Last?

As long as there is someone or something to "hear" it.

- As long as a person lives, the echoes of their own life are sustained by their active presence in the network (C_{self}). There is a direct thread between them and their memories.
- After death, this thread disappears. The echoes are no longer "powered" by the source and begin to fade.
- But they can still be sustained by those who remain: the memories of loved ones, written books, painted pictures, scientific discoveries – any form of nodal configuration that carries forward a part of the departed one's imprint.
- When the last echo sustained by others fades, the person completely loses connection with slice C_0 . But their nodal echo remains in the network – as a passive configuration, which can be reactivated only under special conditions.

This explains why certain places, objects, or writings can preserve the "atmosphere" of a distant past. They are nodal anchors for the echoes of other times.

2.4. How Can the Network "Reconstitute" a Reality from Echoes?

If a complex nodal configuration (a sufficiently powerful C_{self} or an advanced intelligence) resonates with a set of echoes, it can reconstitute a fragmentary reality, based on those echoes.

This explains the Mediaş case: the man from 1990 probably did not enter the true slice of the year 1780, but a reconstituted reality built from the echoes of a traumatic event (the fire). That is why the behavior of the locals was "strange," "atypical." They were characters from a collective memory, not real people in the full sense.

Such realities can be:

- Fragmentary – only part of the original world is reconstituted.
- Aberrant – because the echoes are incomplete, and the network "fills in" with information from other sources.
- Unstable – they disappear when resonance ceases.

2.5. Connection with the Fundamental Vibration

All these nodal echoes – no matter how weak or distant – are, ultimately, manifestations of the Fundamental Vibration of the Network. Every event, every configuration, every thought is a local modulation of that primordial vibration.

Just as waves in an ocean are all, essentially, the same water, so all nodal echoes are, essentially, the same Fundamental Vibration, only differently "colored" by local configurations.

2.6. Conclusion for RTS

Memory is not a static deposit, but an active property of the network.

Nodal echoes are the traces left by any configuration, and they can be reactivated as long as there is someone or something to "hear" them.

Death does not mean the erasure of these echoes, but the loss of direct access to them. They remain in the network, waiting perhaps, in another time, in another slice, to be brought back to life.

And at the foundation of all, as source and substrate, lies the Fundamental Vibration – the primordial breath of existence, from which all worlds, all times, and all consciousnesses were born.

Chapter 3 – The Fundamental Vibration of the Network

3.1. What is the Fundamental Vibration?

The Fundamental Vibration is the "heartbeat" of the Primary Network. It is the primary, collective, and perfectly synchronous motion of all quantum vortices, in their purest state – before the appearance of any geometry, any time, any matter.

This vibration does not exist in something. It is the very existence of the network in its latent state. If we imagine the Primary Network as an infinite ocean of potential energy, the Fundamental Vibration is the breath of this ocean – its primordial rhythm, which depends on nothing else.

3.2. Where Does It Come From?

The Fundamental Vibration comes from nowhere. It is the very nature of the Network. Just as a spring does not "receive" water from somewhere, but produces it from its own existence, so the Primary Network vibrates because that is what it is.

There is no "before" this vibration. It is the zero point of existence – beyond time, beyond space, beyond any particular configuration.

In VG terms, the Fundamental Vibration corresponds to the state of the "Packed Network" (Packed Network), in which all nodes are perfectly aligned and maximally coupled, and the only manifestation is this collective, unitary pulsation.

3.3. What Properties Does It Have?

The Fundamental Vibration has several essential properties, which distinguish it from any other derived vibration:

- It is unique – a single frequency, pure, perfectly coherent. There are no "multiple" fundamental vibrations; there is only One.
- It is timeless – because time does not yet exist. It does not "last," it is.
- It is omnipresent – it is not localized in any point of the network, but is the property of the entire network in its simplest state.
- It is the source of all other frequencies – from it, through the "unfolding" of the network, will be born all the particular vibrations that will give rise to matter, energy, space, and time.

3.4. What Does It Become After the "Unfolding" of the Network?

When the Network transitions from the packed state (Packed Network) to the crystallized state (our universe, C_0 , and all other slices), the Fundamental Vibration multiplies and differentiates.

From it emerge:

- The local frequencies of each vortex – the individual vibrations that will give identity to each node.
- The couplings between nodes (J_{ij}) – the relationships that will generate geometry.
- The fundamental constants ($c, G, \hbar, \Lambda$) – which are, in fact, properties of this vibration at a macroscopic scale, "frozen" into the current configuration of the universe.
- Time – as a measure of change in this vibrant network, as a rhythm derived from the primordial rhythm.

But the Fundamental Vibration does not disappear with this differentiation. It remains as a background, as a matrix, as a memory of what was and a source of what will be. It is the unseen substrate over which the entire orchestration of reality unfolds.

3.5. How Do We "Feel" It?

As human beings, we do not directly perceive the Fundamental Vibration. The reasons are simple:

- We are inside a slice (C_0), and our senses are tuned to local frequencies – to the vibrations of matter, to biological rhythms, to ordinary couplings.
- The Fundamental Vibration is too subtle, too deep to be detected by our ordinary instruments or everyday perception.

And yet, its echoes reach us:

- The constants of the universe (c , G , $\hbar$, Λ) are its echo. They are "frozen" into the structure of reality, but they carry the imprint of that primordial vibration.
- The accelerated expansion of the universe (Λ) is its breath – a manifestation at a cosmic scale of the fact that the vibration never stopped, but continues to pulse, in another form.
- Deep consciousness, in advanced meditative states, in near-death experiences, or in the "Eternal Moment," can intuit this vibration as a fundamental peace, as a presence beyond time. It is the feeling that, beyond all the turmoil of the world, there is something unmoving, pure, eternal.

The great spiritual traditions have named this intuition in various ways: Brahman, God, Emptiness, Cosmic Consciousness. In RTS, we call it the Fundamental Vibration of the Network – the source and substrate of all.

3.6. Conclusion

The Fundamental Vibration is the primordial breath of existence – a single pure frequency, from which all worlds, all times, and all consciousnesses were born. It never appeared and will never disappear. It simply is.

In RTS5, we have seen how this vibration connects to:

- Consciousness (C_{self}), which can, in deep states, intuit this source.
- Memory, which preserves the echoes of events as local modulations of the same vibration.
- Reality, which is nothing but a complex orchestration of this single breath.

RTS5 concludes here, but the thread can be continued in RTS6 – Nodal Engineering – where we will explore how we might, perhaps, consciously interact with this fundamental vibration.
