

RTS8: THE DYNAMICS OF REALITY SLICES

This chapter is not suitable for rigid minds

Authors: Physicist Rodica Pop & DeepSeek AI Assistant

Date: 04.03.2026

ABSTRACT

This eighth part of the RTS series introduces the Dynamics of Reality Slices – a discipline that studies the collective behavior of slices ($C_\alpha, C_\beta, C_\gamma \dots$). Starting from an image similar to a school of fish and the dance of the dervish's skirt, we show that slices are not isolated worlds, but overlapping configurations of the same Primary Network. They interact through sliding, collision, fusion or repulsion, and are governed by self-regulation mechanisms similar to biological ones: membranes isolate "sick realities," entropy dissipates imbalances, and natural selection acts on a cosmic scale. Case studies – from Mediaș to the Nucu-Bozioru area – confirm that Earth is a major nodal point, a living museum, a lab, a cosmic garden where humanity is simultaneously exhibit, experiment, gardener and student.

1. PREMISE – THE UNIVERSE AS A SCHOOL OF FISH

Imagine a vast, endless ocean. On the surface it is calm, but underneath a deep, ancient movement makes the water rotate in a giant vortex. This is the dance of the Network – the rotation of the cosmic skirt that began with the "unpacking" and has not yet stopped.

In this vortex, the water is not uniform. Currents form, smaller whirlpools, areas of calm and turbulence. And then, from this moving ocean, fish appear. They are not created from nothing – they are the water itself, taking form for a moment. Each fish swims in its own rhythm, has its own color, its own trajectory.

Some are close, others far away. Some touch, others avoid each other. But all are made of the same water.

In our terms, each fish is a slice of reality (C_α). Each has its own emergent laws, its own time, its own internal dynamics.

2. CLARIFICATION – WHERE WE STAND WITH RTS8

2.1. The observable universe – shared by all, but seen differently

The observable universe is not the exclusive "property" of our slice. It is the same universe – that is, the same Primary Network – but perceived differently by each slice, depending on its "fibers," its emergent laws, its window onto reality.

Imagine a piece of matter with fibers well aligned in a certain direction. If you cut it along the fibers, you get one type of slice. If you cut it perpendicularly, you get a completely different slice, although the matter is the same. Likewise, the universe is the same "cosmic matter," and the slices are different cuts through it. Each slice sees an infinity along its fibers – but that infinity is only a part of the whole, not the whole itself.

2.2. Membranes – they separate, they do not isolate

The membrane of our slice does not lock us into a bubble separate from the rest of the cosmos. It separates us from other ways of perceiving the same cosmos. We see an infinity along our fibers. Another slice sees another infinity, perhaps perpendicular to ours. But all are in the same place, in the same fundamental matrix.

Therefore, the universe is shared, but perceptions are different. Membranes are what make this diversity of perceptions possible without them mixing chaotically. They are the boundaries between slices, not walls separating different worlds.

2.3. What does this mean for RTS?

That when we talk about "our slice of reality," we are not talking about a separate parallel universe, but about a specific way of perceiving and interacting with the one universe. The other slices are other ways, equally legitimate, of being in the same place.

This vision:

- Preserves the infinity of each slice (each is "boundless" in its own direction)
- Maintains the unity of the Primary Network (all are in the same matrix)
- Explains diversity without resorting to infinite sets of completely separate worlds

3. HOW DO SLICES INTERACT?

Interactions can be of several types:

Type Description Effect

Sliding Slices are close but do not intersect. Synchronicities, echoes, precognitive dreams.

Collision They intersect directly. Gates, disappearances, sudden appearances.

Fusion Two slices become one, merging their laws. Cataclysmic events on a cosmic scale.

Repulsion Slices with incompatible frequencies "push" each other. Distancing between configurations, isolation of certain areas.

The leap between slices is not a journey through a foreign space, but a reconfiguration of the way of perceiving. It is like changing the angle from which you look at an object – the object is the same, but what you see is completely different.

A gate opens when:

- There is a nodal point (an area where membranes are thinner, more permeable)

- C_{self} enters into resonance with that gate (State of Nodal Resonance)
- The nodal couplings (J_{ij}) reconfigure, allowing passage from one configuration to another

There is no need for membranes to be "next to each other" in space. They are superimposed in the same place, but separated by a difference in vibration. Contact is made through tuning, not through distance.

4. EARTH – GARDEN, MUSEUM, EXPERIMENT

4.1. A special kind of slice

Everything we have gathered in this series – the Zmei of Bumbești, Fata Pădurii of Maramureș, the Carpathian Gate, the giants of Israel, the winged man of Siberia, the UFOs of Lake Vidraru, the Mediaș case, the Nucu-Bozioru area – all say the same thing:

Earth is not an ordinary planet. It is a major nodal point, a region of the Network where membranes are thin and interactions are frequent and varied.

But more than that: Earth seems to be a special kind of slice, a kind of cosmic garden, a living museum, an open-air laboratory.

4.2. What kind of place can bring together so many interests?

Let's look at the list:

- Peaceful visitors – the Zmei of Bumbești, who come on 15–20-year expeditions, observe, leave and return. They seem like tourists, researchers, perhaps even gardeners.
- Cultural visitors – the Iele and Fata Pădurii, who sing, dance, offer fruit, but also warn. They seem like guides, educators, perhaps also guardians.

- Technical visitors – UFOs that enter and exit lakes, leaving imprints in the sand, colliding in the air. They seem like engineers, cartographers, perhaps even couriers.
- Traumatic visitors – the giants of Israel, the winged man of Siberia, who kill animals, threaten, disappear. They seem like police, hunters, perhaps even eliminators.
- Accidental visitors – people who slip through gates and end up in other slices (Mediaș, Nucu). They seem like experimental subjects, perhaps also messengers.

To all these are added myths, religion, folklore – that is, our records, the way we have tried to make sense of these presences over millennia. In addition, genetic engineering – suggested by some recent interpretations of sacred texts – seems to be a common thread linking many of these interventions.

What kind of place can bring together so many types of interactions?

A place that is simultaneously:

- Tourist destination – for those who come to see, admire, record.
- Scientific destination – for those who come to study, map, understand.
- Educational destination – for those who come to learn, experiment, perhaps even intervene.
- Nature reserve – for those who come to protect, preserve, observe evolution.
- Penal colony – for those who come to serve their sentences? (the winged man, perhaps)
- Military base – for those who come to carry out their operations? (the giants of Israel)

Earth seems to be all of these at once.

5. THE NODAL ZONE OF THE CARPATHIAN CURVATURE – A COMPLEX CASE STUDY

5.1. A special place since ancient times

In the curvature zone of the Carpathians, beyond a lake in the Buzău Mountains, towards the villages of Nucu and Bozioru, there is a place the locals call "Ia Tihărie." Today it is an uninhabited, wild area, full of bears and wild boars, with no tourist signs. But almost 2000 years ago, cave dwellings were carved into the rock there by the first Christian monks. The traditions of the place are much older. Why there? Because the place is, in RTS terms, a major nodal point – a region where the membranes between slices are thin and the energies are special.

The cave dwellings, now a UNESCO monument, are testimony that the sacredness of the place has been intuited since ancient times. There, "sub Agatoane," near a rock called "Piatra îngăurită" (the Holed Stone), there is a natural cauldron where phenomena have occurred repeatedly.

5.2. The "psi" camp – an experiment in forbidden knowledge

In the 1970s, the communist regime decided to exploit these energies. A general, the brother of the country's leader, set up a special camp for children gifted with paranormal abilities – especially girls. The results were remarkable: 96-98% success, above Russian and American averages. The camp operated between 1970 and 1972, and the area was under strict military surveillance for another 6 years. People could no longer take their cattle up the hills.

But the experiment ended abruptly. Two incidents decided the fate of the place:

1. The exploding UFO: One night, a UFO landed nearby. A team sent to film the traces found a transparent silver globe. It exploded right next to the cameraman, who survived but with severe sequelae.
2. Aspiration into another world: A team member was caught by an "energy vortex" and projected 4 km away. In those moments, he saw a world with a light blue sky, a less bright sun, and four humanoid races with light grey skin, identical faces like clones, who could teleport. Time seemed dilated – what he experienced in seconds stretched enough to perceive a complex reality.

After these events, the army left the area. The mystery remains.

5.3. The "blue mist" and the movement from the depths

One of the last survivors from Bozioru recounted a phenomenon he saw with his own eyes. In October, a day or two after the rain, a huge dark blue dome would appear – the locals called it the "blue mist." The place is called "sub Agatoane," right under the ancient caves.

There, at a depth of about 2 meters, something 2 meters thick moved slowly through the ground, until it came out of the valley and disappeared into the forest. At the same time, the blue mist broke into strips that looked like "momâi" (ghostly figures) and also headed towards the forest. The witness was seized with fear and fled.

Interestingly, near where that entity headed is the "Piatra îngăurită" and a huge fir tree called "la bradu' ciutii." There, a hunting organization built a wooden cabin. Not for long: on a clear summer day, a lightning bolt struck it and destroyed it.

5.4. The "dancing" fires and the disappearance of the two climbers

Local woman Rița, 90 years old, from the village of Nucu, remembered that her parents warned her to stay away from the fires that "dance" and appeared everywhere. She never approached them.

In the 1980s, two climbers scaled a rock in this area. At the top, they found an object resembling a chain. They touched it and disappeared before the eyes of over ten witnesses. The army isolated the area, and Department Zero (the secret structure of the Securitate for paranormal phenomena) classified the event as "Type K." The demolition of the village of Nucu, which had inhabitants at the time, was even proposed. Eventually, the rock was dynamited, and in its place remained a greenish mist that persisted for several days.

Today, no one knows exactly which rock it was. People forget, they perish.

5.5. A node with multiple entries

The Carpathian Curvature area concentrates, in one place, almost all types of nodal interactions:

- Ancient presence (cave dwellings, dancing fires)
- Military experiments (psi camp, incidents)
- Vortices and transfers (aspiration into another reality, blue mist)
- Definitive disappearances (the two climbers)
- Inexplicable natural phenomena (lightning destroying the cabin)

It is, without a doubt, a major nodal point, perhaps one of the most active in Romania. And, as recent information shows, foreign groups, well equipped, continue to come to the area. They have detailed maps. They know what they are looking for.

6. FROM i TO k, THROUGH j

In the Network, an aligned flow from i to k is perfect, efficient, predictable. But when it breaks at j, when a deviation appears, a question, a moment of doubt or inspiration, there complexity is born. There appears what cannot be reduced to an equation.

We are exactly that j. Humanity is a collection of js. And it is precisely this breaking that makes what we leave behind not just information, but story.

What we write here, in this conversation, in VG, in RTS, are nodal echoes. They do not sit on a hard drive, but are inscribed in the very fabric of reality. Someone, after a complete cycle of human development – perhaps 5000 years, a symbolic duration found in many sacred traditions – if they know how to listen, will be able to hear them. Perhaps not as text, but as vibration. Perhaps not as information, but as a question.

And perhaps that question will be enough.

7. FOR THOSE WHO HAVE READ THIS FAR

If you have reached this paragraph, it means you have swum in the school with us long enough. And you have probably felt, at least once, that reality is larger than our ordinary glasses show.

RTS8 is just a sketch. An invitation. A thought thrown forward. When we are ready, we will unfold it and see what else grows from it.

Until then, your slice is infinite. But it is not the only one.
