ABSTRACT

This first chapter of VG Series II explores the profound analogy between the whirling dervish's dance and the dynamics of the Primary Network. The universe is not a passive expansion, but a living fabric inheriting a primordial rotation. The current accelerated expansion is reinterpreted not as a mysterious force, but as the final tightening of the skirt – the last folds of the Network unfolding before settling into equilibrium. The chapter proposes that:

- **The number of nodes remains constant (unlike in LQG).**
- **Expansion is given by the relaxation of couplings, not by node multiplication.**
- **There is a residual cosmic rotation**, a legacy of the primordial dance, which may leave observable signatures in galactic rotation, CMB anomalies, and large-scale structure distribution.
- **The accelerated expansion is a finite phase, not an eternal one.**

This framework offers testable predictions and a new, intuitive understanding of dark energy as the Network's residual tension.

1.1. The Dervish's Dance and the Birth of the Universe

There is an ancient dance, that of the whirling dervishes, in which the wide skirt, spinning, rises and glides, taking on a form that seems alive. When the dance stops, the skirt follows, gathering in rapid waves, folding with force until it exhausts its last momentum.

This image is not just a metaphor. It is a perfect analogy for what happened – and is still happening – at the level of the Primary Network

- The beginning of the dance = the moment of the network's "unpacking" from the packed state (Packed Network), when the maximum tension is suddenly released. This is the phase we call cosmic inflation.
- The gliding skirt = the subsequent expansion, in which the network seeks its equilibrium.
- The skirt gathering at the end = the current accelerated expansion, which we mistakenly interpret as a mysterious force, when in fact it is the final tightening of the skirt, the last folds of the Network unfolding before settling completely.

1.2. Accelerated Expansion – Tightening, Not Pushing

In this vision, dark energy is no longer an external force, but the residual tension of the Network, now manifesting as a final tightening. Expansion is not a push from outside, but an elastic return – exactly as the skirt, when the dance stops, follows and gathers.

This means that what we measure as "acceleration" will not continue indefinitely. At some point, the skirt will have completely gathered, and expansion will cease – perhaps even giving way to a contraction.

1.3. Cosmic Rotation – A Legacy of the Dance

If the Network was born from a state of maximum rotational tension, then expansion also carries within it a rotation component. At our scale, this rotation is hard to perceive – we are inside, carried by it, exactly as the dervish does not feel that he is spinning, but only feels the wind of his skirt.

But it exists. And it leaves traces:

- Galaxy rotation – dark matter is invoked to explain their speeds, but perhaps part of this rotation is inherited from the Network.
- Anomalies in the CMB – if the universe has a privileged direction of rotation, this should leave a signature in the cosmic microwave background.
- Large-scale structure distribution – a cosmic rotation could explain certain observed alignments between galaxies and clusters.

1.4. Towards a Testable Prediction

VG proposes that:

- 1. The number of nodes remains constant (unlike in LQG, where nodes divide).**
- 2. Expansion is given by the relaxation of couplings, not by an increase in the number of nodes.**
- 3. Accelerated expansion is a final phase, not an eternal one.**
- 4. There is a residual cosmic rotation, inherited from the initial state.**

These points are falsifiable:

- Increasingly precise measurements of the CMB will be able to detect (or disprove) the existence of a privileged direction.
- The study of galaxy rotation at different redshifts will be able to show whether this rotation changes over time.
- If expansion slows down in the distant future (or even reverses), VG will be confirmed.

1.5. On the Fold of the Skirt – What We Feel Today

If we were to sit on a fold of the Network's skirt, in this phase we would feel that everything is moving away from us, accelerating. Not because we are pushed by a mysterious force, but because the elasticity of the Network is making its final adjustments before settling. It is the final tightening of the skirt – but seen from within, it appears as an accelerated expansion.

Galaxies seem to flee from us, the fold we sit on thins and widens. This is our sensation of accelerated expansion.

If we were in the actual contraction phase, everything would reverse: galaxies would approach, folds would thicken, the universe would contract.

1.6. Conclusion

The universe is not a passive expanse, but a Network that dances. We are inside this dance, carried by its rotation, witnesses to the last folds unfolding. Accelerated expansion is not a mysterious force, but the skirt tightening.

When the dance stops, perhaps we will finally understand that everything was just a breath of the Network.
