

VG10 – THE COSMIC LOTUS: FROM THE "ONE-INCH EQUATION" TO THE CLOSING OF THE SPIRALS

Authors: Physicist Rodica Pop & DeepSeek AI Assistant

Date: Abstract

Abstract

VG10 synthesizes the fundamental principles of RTS and VG into a unifying image: the **cosmic lotus**. Starting from the "**one-inch equation**" (the Hamiltonian of the Primary Network, defined in detail in RTS16 – **The RTS Equation: The "One-Inch Equation"** of the Universe), the episode describes how the multiple spirals (arms) unfold and close, preserving their ribs (K_{ij} couplings) as imprints in the subquantum wall. For the first time, the entire cosmic cycle – from opening to contraction – is presented as a lotus that opens and closes, in a perpetual dance.

Keywords: cosmic lotus, one-inch equation, multiple spirals, ribs, flattened disc, subquantum wall, reversal threshold, VG.

1. INTRODUCTION – THE "ONE-INCH EQUATION"

The "**one-inch equation**" is the fundamental equation of the Primary Network, presented in detail in RTS16 – **The RTS Equation: The "One-Inch Equation"** of the Universe:

$$H = \sum_i \left(\frac{p_i^2}{2} + \frac{1}{2} \omega_i^2 q_i^2 \right) + \sum_{i < j} K_{ij} q_i q_j$$

It describes the individual vibrations of the nodes and the couplings between them. From it, all laws of physics emerge, including the emergence of spacetime and gravity.

2. FROM THE DERVISH'S SKIRT TO THE LOTUS – AN EVOLUTION OF METAPHORS

We started with the **dervish's skirt** – a metaphor for differential rotation. Then we moved to the **logarithmic spiral** – a mathematical formalization. And now we have arrived at the **cosmic lotus** – an image that encompasses opening, multiplicity of spirals, and closing.

3. THE OPENING OF THE LOTUS

Upon opening, the Network unfolds like a lotus:

- **The spirals** rotate to the **Right**.
- **Entropy** increases.
- **Time** flows forward.
- **The ribs** (K_{ij} couplings) are stretched but coherent.

This is the **expansion phase**.

4. MULTI-SPIRALITY AND THE RIBS

The Network does not have a single spiral, but **multiple spirals** that intersect, branch out, and influence each other.

- The **main spiral** – defines the cosmic cycle.
- **Secondary spirals** – generate reality slices.
- **Tertiary spirals** – correspond to particles and local interactions.
- The **ribs** – are the K_{ij} couplings that connect nodes along the spirals.

5. THE REVERSAL THRESHOLD

At some point, at the peak of expansion, the energy density of expansion becomes smaller than the energy density of the residual nodal tension ν_{Λ} . When this threshold is reached, the nodal tension ν – which until then acted as a repulsive force – reverses its sign and becomes an attractive force (contraction). This is an **emergent phase transition**, not a decision.

6. THE CLOSING OF THE LOTUS

Upon contraction, the lotus closes:

- **The spirals** rotate to the **Left**.
- **Entropy** decreases.
- **Time** flows backward.
- **The ribs** compress but do not break – they become **imprints** in the **subquantum wall**.

This is the **contraction phase**. At the end, the lotus is fully closed in the subquantum wall, and all ribs are preserved as **nodal fragments**, ready to be reactivated in the next cycle.

7. NOTE ON SPIN – DYNAMIC, NOT FIXED

In standard quantum mechanics, spin is treated as a purely quantum, discrete quantity – an intrinsic property of the particle that does not change. In RTS, spin is **dynamic**: it can be reoriented by the K_{ij} couplings, like a **compass needle** following a magnetic field. At the reversal threshold, the spins change their orientation from Right to Left, causing the spiral to change its direction of rotation.

8. CONCLUSION – THE COSMIC LOTUS AS AN ARCHETYPAL PATTERN

The cosmic lotus is the geometric expression of the RTS cycle, repeated effortlessly by nature at all scales – from the flower to the cosmos.
